Using MetaPost-Generated Graphics in LaTeX

osurs@bluewin.ch   Urs Oswald   http://www.ursoswald.ch

September 28, 2002

The table shows how MetaPost-generated graphics can be imported in LaTeX2_ε. Let `mpsimage.1` be an image generated by MetaPost, and let mpsimage.eps be obtained by renaming `mpsimage.1`.

⟨file⟩	latex + dvips	latex2html 2002 - 1	pdflatex 3.14159-1.00a
	\usepackage{graphicx} \includegraphics{⟨file⟩}		
		\usepackage{color} \pagecolor{white}	\DeclareGraphicsRule {*}{mps}{*}{}
mpsimage.1	+	+	+
mpsimage.eps	+	+	+
mpsimage	only for mpsimage.eps	only for mpsimage.eps	-
	PS	HTML + PNG	PDF

Using package color with `latex2html`

While `latex2html` version 2002-1 produces transparent images, many browsers cannot deal correctly with transparent png images (one exception: mozilla).

Earlier versions of `latex2html` showed some deficiencies (black borders). The newest versions can be downloaded from `http://www.latex2html.org`.
